

## Chapter 11

### *Properties of Solutions*

## Section 11.1

### *Solution Composition*

**Do in your notes, compare with partner**

- A solution is prepared by mixing 1.00 g ethanol ( $\text{C}_2\text{H}_5\text{OH}$ ) with 100.0 g water to give a final volume of 101 mL
  - Calculate the molarity, and mole fraction of ethanol in this solution

# Section 11.1

## *Solution Composition*

### Interactive Example 11.1 - Solution

#### ■ Molarity

- The moles of ethanol can be obtained from its molar mass (46.07 g/mol):

$$1.00 \text{ g C}_2\text{H}_5\text{OH} \times \frac{1 \text{ mol C}_2\text{H}_5\text{OH}}{46.07 \text{ g C}_2\text{H}_5\text{OH}} = 2.17 \times 10^{-2} \text{ mol C}_2\text{H}_5\text{OH}$$

$$\text{Volume} = 101 \text{ mL} \times \frac{1 \text{ L}}{1000 \text{ mL}} = 0.101 \text{ L}$$

# Section 11.1

## *Solution Composition*

### Interactive Example 11.1 - Solution (Continued 1)

$$\text{Molarity of C}_2\text{H}_5\text{OH} = \frac{\text{moles of C}_2\text{H}_5\text{OH}}{\text{liters of solution}} = \frac{2.17 \times 10^{-2} \text{ mol}}{0.101 \text{ L}}$$

$$\text{Molarity of C}_2\text{H}_5\text{OH} = 0.215 \text{ M}$$

# Section 11.1

## *Solution Composition*

### Interactive Example 11.1 - Solution (Continued 2)

#### ■ Mole fraction

$$\text{Mole fraction of C}_2\text{H}_5\text{OH} = \frac{n_{\text{C}_2\text{H}_5\text{OH}}}{n_{\text{C}_2\text{H}_5\text{OH}} + n_{\text{H}_2\text{O}}}$$

$$n_{\text{H}_2\text{O}} = 100.0 \text{ g H}_2\text{O} \times \frac{1 \text{ mol H}_2\text{O}}{18.0 \text{ g H}_2\text{O}} = 5.56 \text{ mol}$$

$$\chi_{\text{C}_2\text{H}_5\text{OH}} = \frac{2.17 \times 10^{-2} \text{ mol}}{2.17 \times 10^{-2} \text{ mol} + 5.56 \text{ mol}} = \frac{2.17 \times 10^{-2}}{5.58} = 0.00389$$

# Section 11.1

## *Solution Composition*

### **Answer with partner, compare with another group**

- You are given two aqueous solutions with different ionic solutes (Solution A and Solution B)
  - Solution A has a greater concentration than Solution B by mass percent, but Solution B has a greater concentration than Solution A in terms of molality.
    - Is this possible?
      - If not, explain why not
      - If it is possible, provide example solutes for A and B and justify your answer with calculations

# Section 11.1

## *Solution Composition*

### Normality ( $N$ )

- Measure of concentration
- Number of equivalents per liter of solution
  - Definition of an equivalent depends on the reaction that takes place in a solution

# Section 11.1

## *Solution Composition*

**Do in your notes, compare with partner**

- The electrolyte in automobile lead storage batteries is a 3.75 *M* sulfuric acid solution that has a density of 1.230 g/mL
  - Calculate the mass percent and normality of the sulfuric acid

# Section 11.1

## *Solution Composition*

### Interactive Example 11.2 - Solution

- What is the density of the solution in grams per liter?

$$1.230 \frac{\text{g}}{\text{mL}} \times \frac{1000 \text{ mL}}{1 \text{ L}} = 1.230 \times 10^3 \text{ g/L}$$

- What mass of  $\text{H}_2\text{SO}_4$  is present in 1.00 L of solution?
  - We know 1 liter of this solution contains 1230 g of the mixture of sulfuric acid and water

# Section 11.1

## *Solution Composition*

### Interactive Example 11.2 - Solution (Continued 1)

- Since the solution is 3.75 *M*, we know that 3.75 moles of H<sub>2</sub>SO<sub>4</sub> is present per liter of solution
- The number of grams of H<sub>2</sub>SO<sub>4</sub> present is

$$3.75 \text{ mol} \times \frac{98.0 \text{ g H}_2\text{SO}_4}{1 \text{ mol}} = 368 \text{ g H}_2\text{SO}_4$$

# Section 11.1

## *Solution Composition*

### Interactive Example 11.2 - Solution (Continued 2)

- How much water is present in 1.00 L of solution?
  - The amount of water present in 1 liter of solution is obtained from the difference

$$1230 \text{ g solution} - 368 \text{ g H}_2\text{SO}_4 = 862 \text{ g H}_2\text{O}$$

# Section 11.1

## *Solution Composition*

### Interactive Example 11.2 - Solution (Continued 5)

- What is the normality?
  - Since each sulfuric acid molecule can furnish two protons, 1 mole of  $\text{H}_2\text{SO}_4$  represents 2 equivalents
  - Thus, a solution with 3.75 moles of  $\text{H}_2\text{SO}_4$  per liter contains  $2 \times 3.75 = 7.50$  equivalents per liter
    - The normality is 7.50 *N*

## Section 11.2

# *The Energies of Solution Formation*

### Steps Involved in the Formation of a Liquid Solution

1. Expand the solute (endothermic)
  - Separate the solute into its individual components
2. Expand the solvent (endothermic)
  - Overcome intermolecular forces in the solvent
3. Allow the solute and solvent to interact (exothermic)

## Section 11.2

# *The Energies of Solution Formation*

### Enthalpy (Heat) of Solution ( $\Delta H_{\text{soln}}$ )

- Enthalpy change associated with the formation of the solution is the sum of the  $\Delta H$  values for the steps:

$$\Delta H_{\text{soln}} = \Delta H_1 + \Delta H_2 + \Delta H_3$$

- $\Delta H_{\text{soln}}$  can have a positive sign when energy is absorbed or a negative sign when energy is released

## Section 11.2

# *The Energies of Solution Formation*

### Factors That Favor a Process

- Increase in probability of the mixed state when the solute and solvent are placed together
- Processes that require large amounts of energy tend not to occur
- Like dissolves like

## Section 11.2

### *The Energies of Solution Formation*

**Answer in your notes, compare with partner**

- Decide whether liquid hexane ( $C_6H_{14}$ ) or liquid methanol ( $CH_3OH$ ) is the more appropriate solvent for the substances grease ( $C_{20}H_{42}$ ) and potassium iodide (KI)

## Section 11.2

### *The Energies of Solution Formation*

#### Interactive Example 11.3 - Solution

- Hexane is a nonpolar solvent because it contains C—H bonds
  - Hexane will work best for the nonpolar solute grease
- Methanol has an O—H group that makes it significantly polar
  - Will serve as the better solvent for the ionic solid KI

# Section 11.4

## *The Vapor Pressures of Solutions*

### Vapor Pressures of Solutions

- Presence of a nonvolatile solute lowers the vapor pressure of a solvent
  - Inhibits the escape of solvent molecules

Pure solvent

Solution with a nonvolatile solute

# Section 11.8

## *Colloids*

### The Tyndall Effect

- Scattering of light by particles
- Used to distinguish between a suspension and a true solution
  - When a beam of intense light is projected:
    - The beam is visible from the side in a suspension
    - The light beam is invisible in a true solution

# Section 11.8

## *Colloids*
